

The **Google Directory Events trigger** allows you to **automate your workflows based on various events that occur within your Google Directory**.

Here's a breakdown of the **Google Directory Events trigger**:

- **Triggering Events:** This trigger can start a Zenphi flow when any of the following events occur in your Google Directory:
 - **Admin privileges granted**
 - **Admin privileges revoked**
 - **Gmail account reset**
 - **Password changed**
 - **Recovery email added**
 - **Recovery email changed**
 - **Recovery email removed**
 - **Recovery phone added**
 - **Recovery phone changed**
 - **Recovery phone removed**
 - **Security key registered**
 - **Security key revoked**
 - **User archived**
 - **User created**
 - **User deleted**
 - **User suspended**
 - **User unarchived**
 - **User undeleted**
 - **User unsuspended**

To **configure** the trigger, you have the following tabs available:

- **Settings**
 - **Connection:** Select or create a Google Audit Report connection for access to Directory events.
 - **Event:** Select one of the events in the dropdown list that you wish the Flow to trigger for.
 - **Filters:** Specify what parameter to filter for in the event. See details on parameters at [Admin Audit Activity Events - User Settings](#)
- **Use Cases:** The wide range of triggering events makes the **Google Directory Events trigger** useful for automating various user and security management tasks, such as:

- **Security Notifications:** Triggering alerts when admin privileges are granted or revoked, or when security settings like recovery emails or phones are changed.
- **User Lifecycle Management:** Automating onboarding tasks when a user is created, offboarding tasks when a user is deleted or suspended, and processes for archiving or unarchiving users.
- **Password and Account Recovery Management:** Initiating workflows when passwords are changed or recovery options are modified.
- **Device Security:** Potentially integrating with device management workflows when security keys are registered or revoked (though this is not explicitly stated, it's a plausible use case given the event).

In summary, the **Google Directory Events trigger** in Zenphi allows you to build powerful automation workflows that respond in near real-time to changes within your Google Workspace user directory, enhancing security, streamlining user management, and improving overall administrative efficiency.
